

Lesson 9

Place Value: Tens Hundreds & Thousands

This is the quick guide to the video. For more complete details watch video 9.

Goals:

- To show the role of "bringing down"
- To show how "place value" comes into long division

Bringing Down

Here is a long division, modelled by currency:

$$8 \overline{) 263}$$

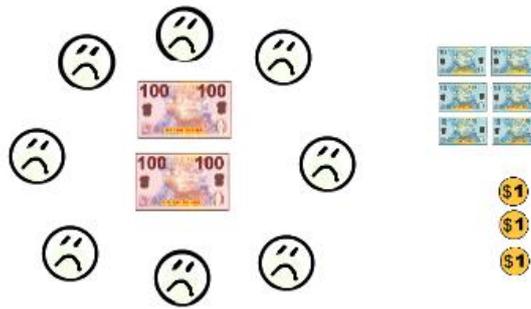

The "263" shows the 2 as 2 hundred dollar bills, the 6 as 6 ten dollar bills and the 3 as 3 one dollar coins.

So it models place value.

We begin our division by saying "8's into 2" won't go.

This is demonstrated below:

$$\begin{array}{r} 0 \\ 8 \overline{) 263} \\ \underline{0} \\ 63 \end{array}$$

Putting aside the \$63 (to the right)

there is no way 8 people can divide up 2 one-hundred-dollar bills

So the answer is 0

At this point the importance of place value becomes apparent.

Each \$100 bill is worth **TEN** \$10 bills.

Exchanging each of them for **TEN** \$10 bills that makes

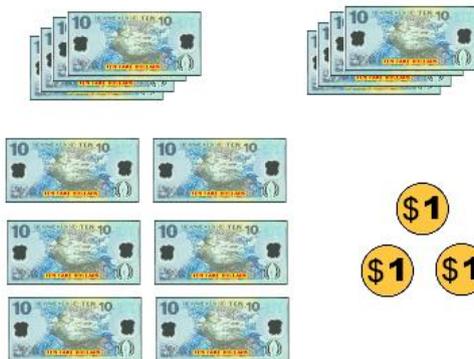

a total of **TWENTY** \$10 bills.

But wait...

There are another **SIX** \$10 bills on the right

So that's a total of **TWENTY-SIX** \$10 bills

That amount can be shared!

Two piles of 10 and another 6 makes 26 ten-dollar-bills in total

$$\begin{array}{r} 0 \\ 8 \overline{) 263} \end{array}$$

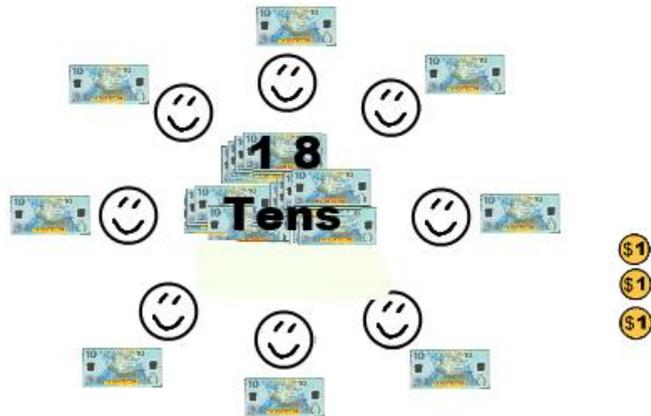

26 can be divided up between 8 people.

Divide by subtracting:

Each person grabs one \$10 bill

That leaves $26 - 8 = 18$ ten dollar bills:

$$\begin{array}{r} 0 \\ 8 \overline{) 263} \\ \underline{18} \end{array}$$

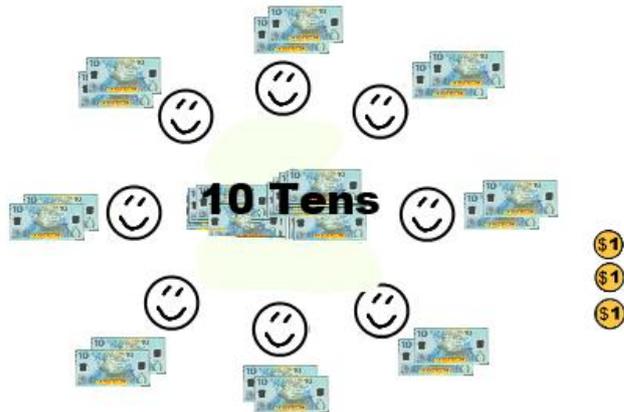

Each person grabs another \$10 bill each.

Another 8 bills are taken off the pile.

That leaves $18 - 8 = 10$ ten dollar bills:

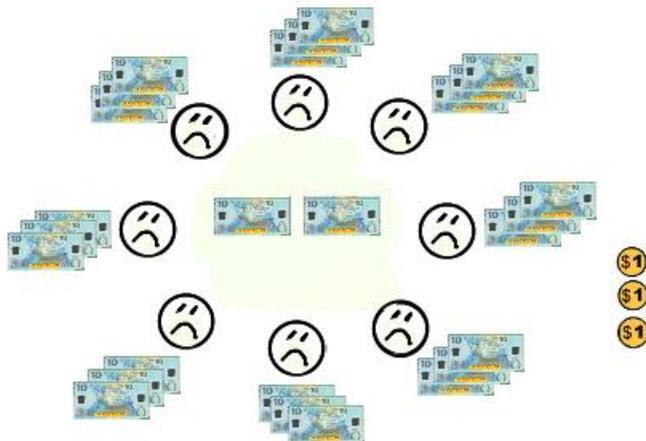

$$\begin{array}{r} 0 \\ 8 \overline{) 263} \\ \underline{18} \\ 10 \end{array}$$

One more time...

Each person grabs another \$10 bill apiece.
 That leaves $10 - 8 = 2$ ten dollar bills left.
 And you can't divide 2 items by 8 people!

$$\begin{array}{r} 0 \\ 8 \overline{) 263} \\ \underline{18} \\ 10 \\ \underline{02} \end{array}$$

We have TWO \$10 bills and THREE \$1 coins left undivided at this stage.

But let's see what has been divided successfully so far:

Each subtraction the pile went down by 8

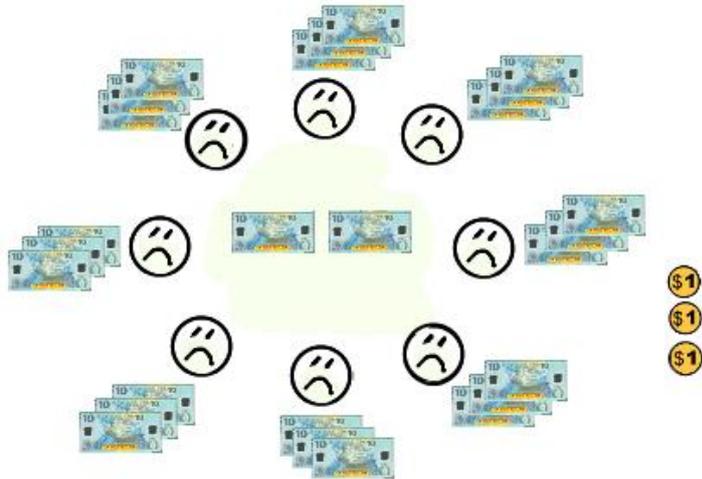

Each person got one more \$10 bill

There were 3 subtractions

The partial answer is 3

meaning 3 TENS

$$\begin{array}{r} 03 \\ 8 \overline{) 263} \\ \underline{18} \\ 10 \\ \underline{02} \end{array}$$

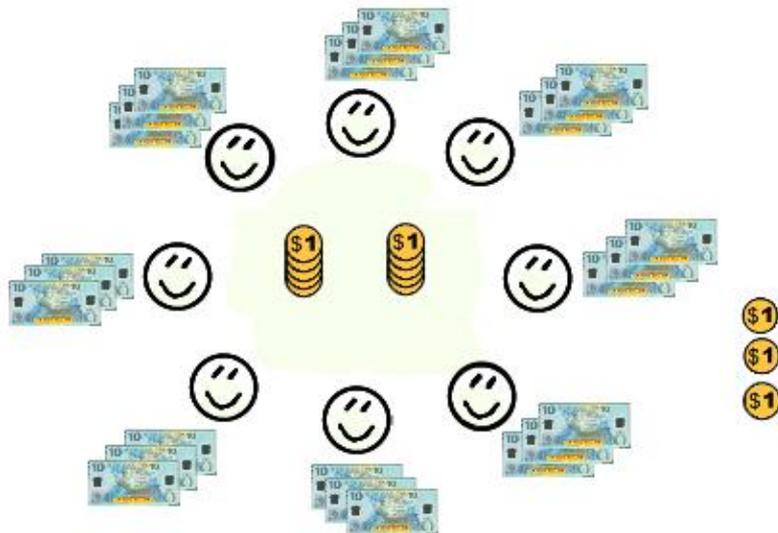

Place value jumps in again.

Each \$10 bill can be exchanged for TEN \$1 gold coins

We have two of them

so we have 20 one-dollar-coins

If we include the THREE \$1 gold coins we haven't touched yet
 that's a total of 23 gold coins.
 Which CAN be divided by 8:

Adding on the 3 extra unused gold coins
 is the meaning of
 "Bringing Down"

$$\begin{array}{r}
 03 \\
 \hline
 8 \overline{) 263} \\
 \underline{18} \\
 10 \\
 \underline{023} \\
 \hline
 \end{array}$$

Notice how in the sum on the left
 the "02" remainder

(which meant 02 TENS)

becomes worth 20 dollar coins

when the 3 is added onto it to make a total of 23

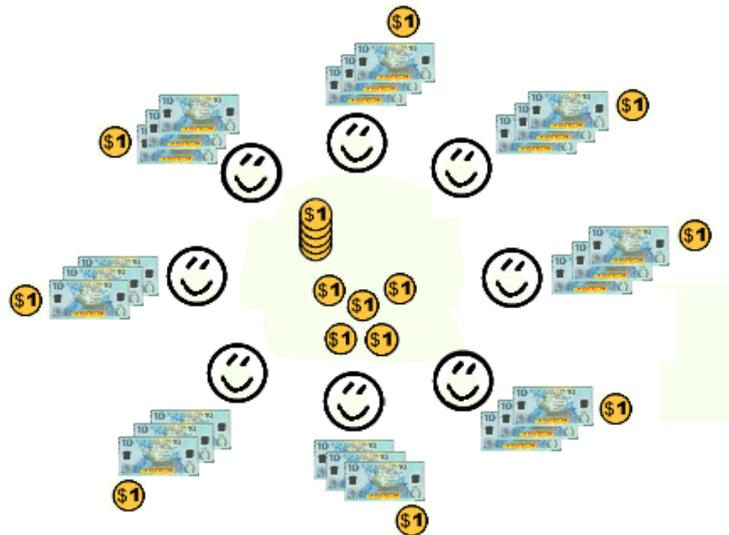

The 23 can be divided by subtracting:

Each person takes one gold coin

That's a total of 8 gold coins less from the pile,

leaving $23 - 8 = 15$

$$\begin{array}{r} 03 \\ 8 \overline{) 263} \\ \underline{18} \\ 10 \\ \underline{023} \\ 15 \end{array}$$

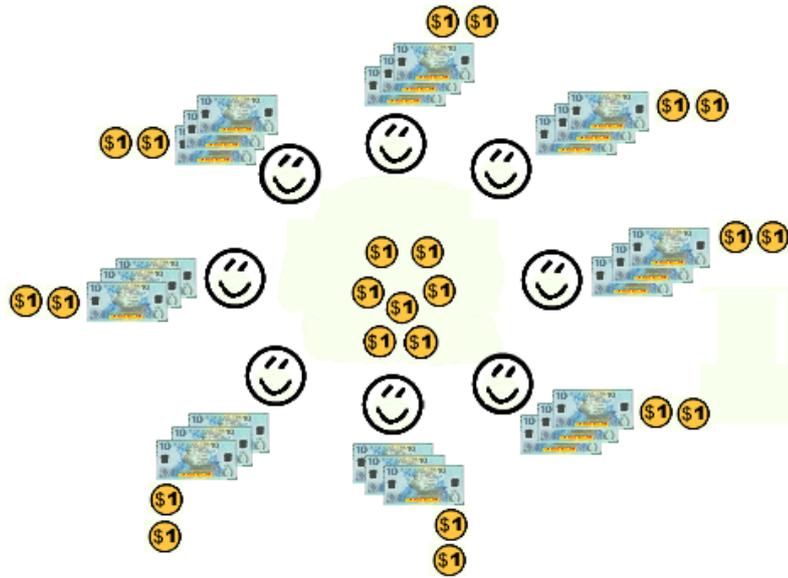

They can do it one more time.

Each person takes a final gold coin from the pile.

That's another 8 off the total,

leaving $15 - 8 = 07$ coins

$$\begin{array}{r}
 032 \\
 8 \overline{) 263} \\
 \underline{18} \\
 10 \\
 \underline{023} \\
 2 \\
 \underline{15} \\
 07 \\
 \hline
 \end{array}$$

There were two subtractions

Each time removing a total of 8 coins

And now each person has exactly 2 gold coins

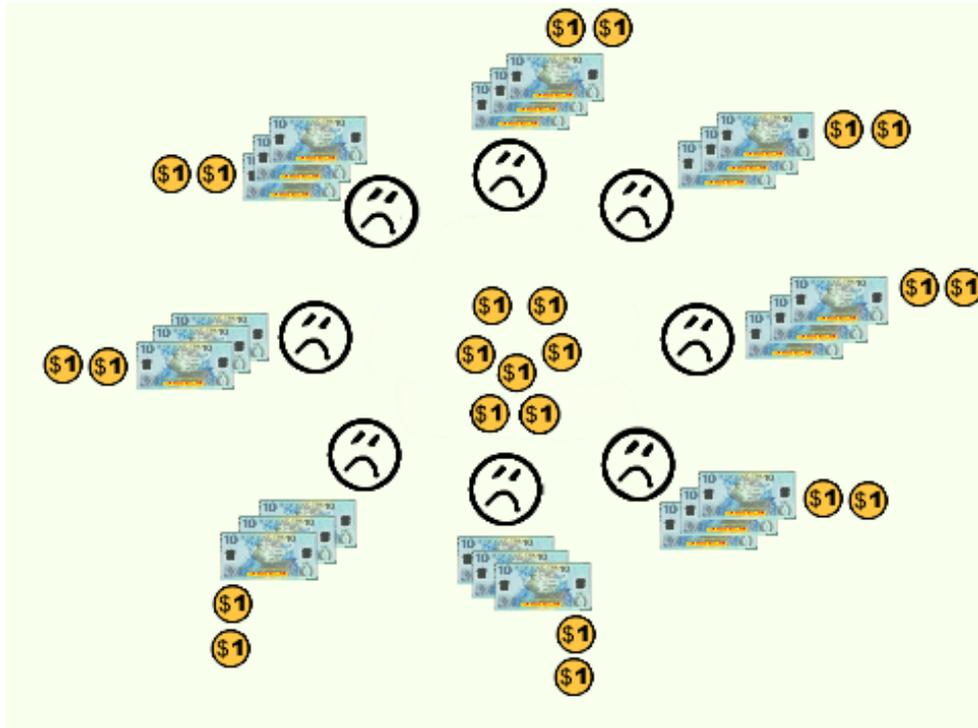

So the 2

is the next digit of the answer

It stands for 2 units (one-dollar-coins).

It is impossible to subtract further

as we can't take 8 off 7

So the division stops.

And we say we have 7 remainder.

(We could go further, breaking the 7 remaining dollars into cents but that's another story).

$$\begin{array}{r}
 032 \text{ r } 7 \\
 8 \overline{) 263} \\
 \underline{18} \\
 10 \\
 \underline{023} \\
 15 \\
 \underline{07} \\

 \end{array}$$
